Machine Learning

#### Classification

- → Email: Spam / Not Spam?
- → Online Transactions: Fraudulent (Yes / No)?
- > Tumor: Malignant / Benign?

$$y \in \{0,1\}$$
 0: "Negative Class" (e.g., benign tumor) 1: "Positive Class" (e.g., malignant tumor) 
$$y \in \{0,1\}$$
 1: "Positive Class" (e.g., malignant tumor)

 $\rightarrow$  Threshold classifier output  $h_{\theta}(x)$  at 0.5:

If 
$$h_{\theta}(x) \geq 0.5$$
, predict "y = 1" If  $h_{\theta}(x) < 0.5$ , predict "y = 0"

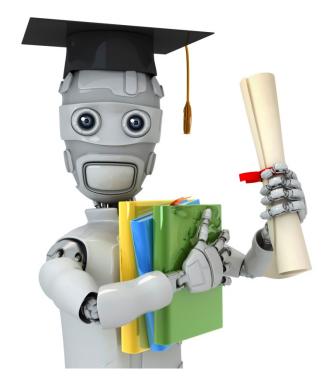

Classification: 
$$y = 0$$
 or 1

$$h_{\theta}(x)$$
 can be  $\geq 1$  or  $\leq 0$ 

Logistic Regression: 
$$0 \le h_{\theta}(x) \le 1$$

$$0 \le h_{\theta}(x) \le 1$$

**Machine Learning** 

# Logistic Regression

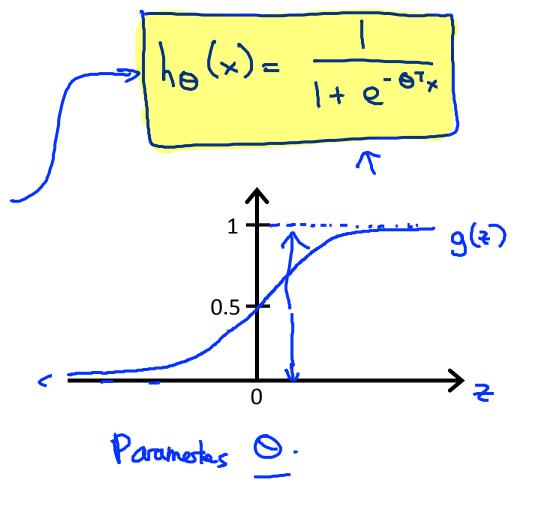

Hypothesis Representation

## **Logistic Regression Model**

Want 
$$0 \le h_{\theta}(x) \le 1$$

$$h_{\theta}(x) = g(\theta^T x)$$

Sigmoid functionLogistic function

## **Interpretation of Hypothesis Output**

$$h_{\theta}(x)$$
 = estimated probability that  $y = 1$  on input  $x \leftarrow$ 

Example: If 
$$x = \begin{bmatrix} x_0 \\ x_1 \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ \text{tumorSize} \end{bmatrix}$$

$$h_{\theta}(x) = 0.7$$

Tell patient that 70% chance of tumor being malignant

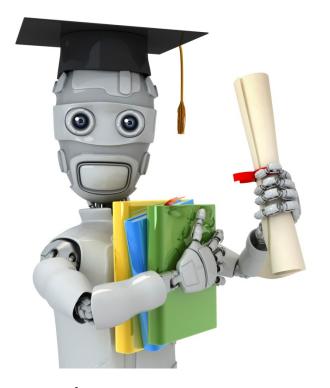

$$he(x) = P(y=1|x;e)$$

$$y = 0 \text{ or } 1$$

"probability that 
$$y = 1$$
, given  $x$ , parameterized by  $\theta$ "

$$P(y=0|y) + P(y=1|y) =$$

$$\rightarrow P(y=0|x;\theta) = 1 - P(y=1|x;\theta)$$

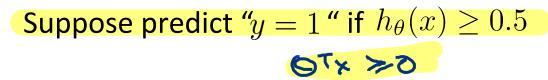

## Machine Learning

# Logistic Regression

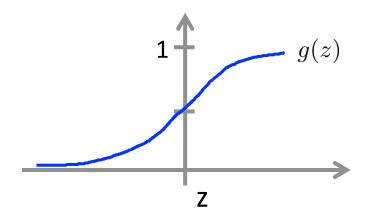

Decision boundary

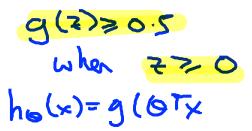

## **Logistic regression**

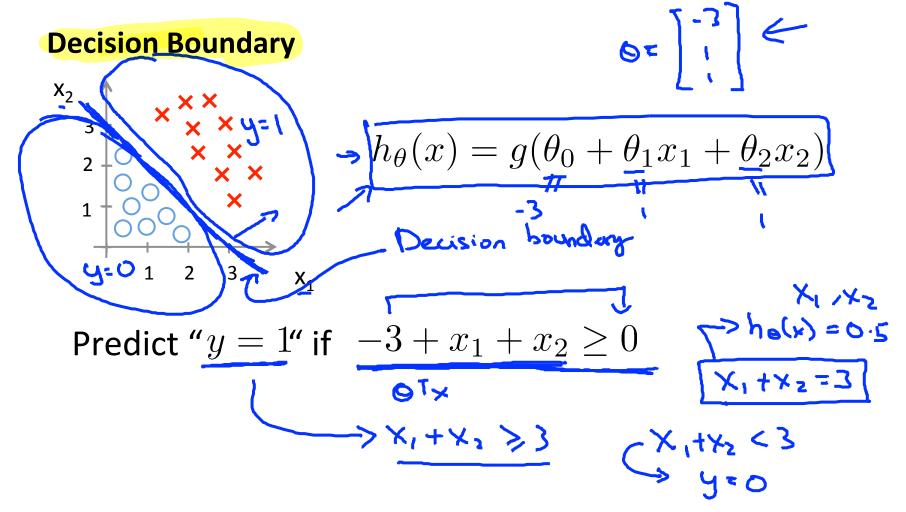

$$h_{\theta}(x) = g(\theta^T x)$$
$$g(z) = \frac{1}{1 + e^{-z}}$$

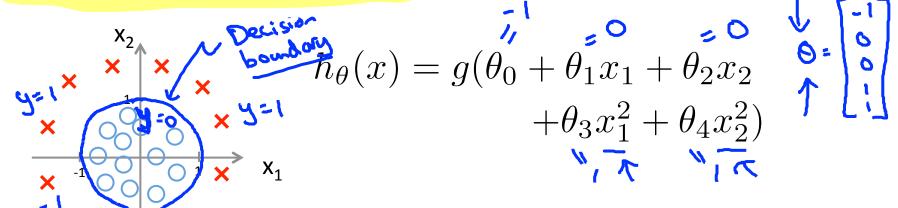

predict "
$$y=0$$
" if  $h_{\theta}(x)<0.5$ 

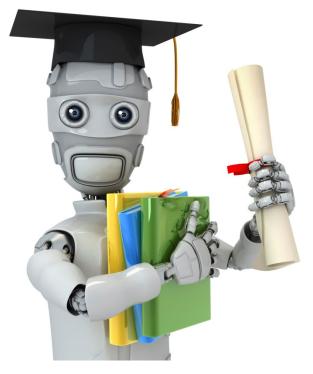

#### Non-linear decision boundaries

Predict "
$$y = 1$$
" if  $-1 + x_1^2 + x_2^2 \ge 0$ 

$$h_{\theta}(x) = g(\theta_0 + \theta_1 x_1 + \theta_2 x_2 + \theta_3 x_1^2 + \theta_4 x_1^2 x_2 + \theta_5 x_1^2 x_2^2 + \theta_6 x_1^3 x_2 + \dots)$$

## **Machine Learning**

# Logistic Regression

# Cost function

 $\{(x^{(1)}, y^{(1)}), (x^{(2)}, y^{(2)}), \cdots, (x^{(m)}, y^{(m)})\}$ 

$$h_{\theta}(x) = \frac{1}{1 + e^{-\underline{\theta}^T x}}$$

How to choose parameters  $\theta$ ?

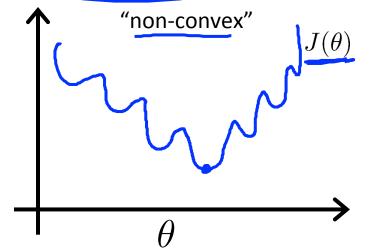

#### **Cost function**

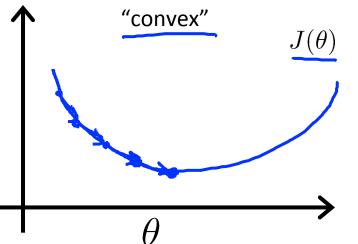

→ Linear regression:

$$J(\theta) = \frac{1}{m} \sum_{i=1}^{m} \frac{1}{2} \left( h_{\theta}(x^{(i)}) - y^{(i)} \right)^{2}$$

 $> (ost(he(x^{(i)}),$ 

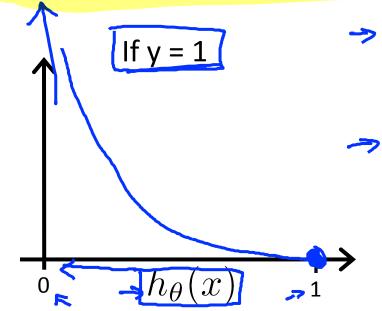

$$\operatorname{Cost}(h_{\theta}(x^{\bullet}), y^{\bullet}) = \frac{1}{2} \left( h_{\theta}(x^{\bullet}) - y^{\bullet} \right)^{2} \longleftarrow$$

## **Logistic regression cost function**

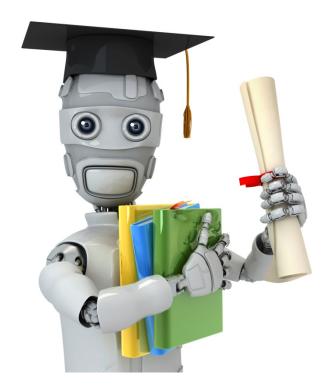

$$Cost(h_{\theta}(x), y) = \begin{cases} -\log(h_{\theta}(x)) & \text{if } y = 1\\ -\log(1 - h_{\theta}(x)) & \text{if } y = 0 \end{cases}$$

Sost = 0 if 
$$y = 1, h_{\theta}(x) = 1$$
But as  $h_{\theta}(x) \to 0$ 
 $Cost \to \infty$ 

Captures intuition that if  $h_{\theta}(x) = 0$ , (predict  $P(y = 1|x; \theta) = 0$ ), but y = 1, we'll penalize learning algorithm by a very large cost.

#### Logistic regression cost function

Machine Learning

# Logistic Regression

Simplified cost function and gradient descent

## Logistic regression cost function

## Logistic regression cost function

$$J(\theta) = \frac{1}{m} \sum_{i=1}^{m} \text{Cost}(h_{\theta}(x^{(i)}), y^{(i)})$$

$$= -\frac{1}{m} \left[ \sum_{i=1}^{m} y^{(i)} \log h_{\theta}(x^{(i)}) + (1 - y^{(i)}) \log (1 - h_{\theta}(x^{(i)})) \right]$$

To fit parameters  $\theta$ :

$$\min_{\theta} J(\theta)$$
 Great  $\Theta$ 

To make a prediction given new x:

Output 
$$h_{\theta}(x) = \frac{1}{1 + e^{-\theta^T x}}$$

#### Gradient Descent

$$J(\theta) = -\frac{1}{m} \left[ \sum_{i=1}^{m} y^{(i)} \log h_{\theta}(x^{(i)}) + (1 - y^{(i)}) \log (1 - h_{\theta}(x^{(i)})) \right]$$

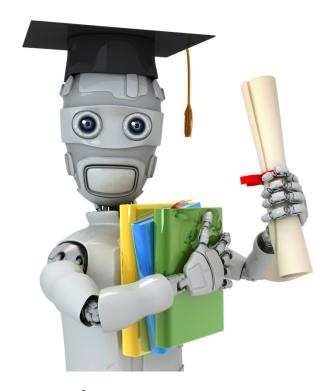

# Want $\min_{\theta} J(\theta)$ :

Repeat {  $\theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta)$ (simultaneously update all  $\theta_j$ ) 2 J(0) = 1 & (ho(x(1)) - y(1)) x;

#### **Gradient Descent**

$$J(\theta) = -\frac{1}{m} \left[ \sum_{i=1}^{m} y^{(i)} \log h_{\theta}(x^{(i)}) + (1 - y^{(i)}) \log (1 - h_{\theta}(x^{(i)})) \right]$$
 Want  $\min_{\theta} J(\theta)$ :
$$\text{Repeat } \left\{ \frac{\theta_{j} := \theta_{j} - \alpha \sum_{i=1}^{m} \left( h_{\theta}(x^{(i)}) - y^{(i)} \right) x_{j}^{(i)}}{\left( \text{simultaneously update all } \theta_{j} \right)} \right\}$$

Algorithm looks identical to linear regression!

Machine Learning

# Logistic Regression

# Advanced optimization

### **Optimization algorithm**

Cost function  $\underline{J(\theta)}$ . Want  $\min_{\theta} J(\underline{\theta})$ .

Given  $\theta$ , we have code that can compute

Gradient descent:

$$\rightarrow \theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta)$$

#### **Optimization algorithm**

Given  $\theta$ , we have code that can compute

#### Optimization algorithms:

- Gradient descent
  - Conjugate gradient
  - BFGS
  - L-BFGS

#### Advantages:

- No need to manually pick  $\alpha$
- Often faster than gradient descent.

#### Disadvantages:

More complex

```
Example: min 3(0)
                                                function [jVal, gradient]
\Rightarrow \theta = \begin{bmatrix} \theta_1 \\ \theta_2 \end{bmatrix} \quad \text{o.s.} \quad \text{o.s.}
                                                               = costFunction(theta)
                                                   jVal = (\underline{theta(1)-5)^2} + \dots
                                                               (theta(2)-5)^2;
J(\theta) = (\theta_1 - 5)^2 + (\theta_2 - 5)^2
                                                   gradient = zeros(2,1);
\rightarrow \frac{\partial}{\partial \theta_1} J(\theta) = 2(\theta_1 - 5)
                                                   gradient(1) = 2*(theta(1)-5);
                                                  -gradient(2) = 2*(theta(2)-5);
\rightarrow \frac{\partial}{\partial \theta_2} J(\theta) = 2(\theta_2 - 5)
-> options = optimset(\(\frac{\GradObj', \on'}{\on'}\), \(\frac{\MaxIter', \on'}{\OMBOSON}\));
\rightarrow initialTheta = zeros(2,1);
 [optTheta, functionVal, exitFlag] ...
       = fminunc(@costFunction, initialTheta, options);
                                         Och d>2
```

```
\begin{array}{c} \theta_0 \\ \theta_1 \\ \vdots \\ \theta_n \end{array} theta(2)
\vdots \\ \theta_n \end{array}
theta =
function (jVal) (gradient) = costFunction(theta)
          jVal = [code to compute J(\theta)
          gradient (1)) = [code to compute \frac{\partial}{\partial \theta}
          gradient(2) = [code to compute \frac{\partial}{\partial \theta}
         gradient (n+1) = [code to compute \frac{\partial}{\partial \theta_r} J(\theta)
```

# Binary classification:

# Multi-class classification:

# One-vs-all (one-vs-rest):

#### One-vs-all

Train a logistic regression classifier  $h_{\theta}^{(i)}(x)$  for each class i to predict the probability that y=i.

On a new input  $\underline{x}$ , to make a prediction, pick the class i that maximizes

$$\max_{i} h_{\theta}^{(i)}(x)$$
